

Git Clone

In Git, cloning is the process of duplicating a repository. Whether it's located remotely or locally, cloning creates a copy of the target repository. You can clone a remote repository to establish a local copy on your system, enabling you to synchronize changes between the local and remote repositories.

Git Clone Repository

```
git clone https://github.com/captain-binary/demo
```

Cloning a Repository into a Specific Local Folder

```
git clone https://github.com/captain-binary/demo "new folder"
```

Download as Zip

```
curl -L -o demo.zip https://github.com/captain-binary/demo/archive/master.zip
```
