Git commit locally command

This command changes the head. It records or snapshots the file permanently in the version history with a message.

```
git commit -m " Commit Message"
```

Git Log

The `git log` command is used to display the commit history of a Git repository.

```
git log
```

Switch between commits

To switch between commits in Git, you can use `git checkout` with the commit's identifier (usually its SHA-1 hash). This allows you to temporarily navigate the repository's history and examine the state at different points in time.

```
git checkout <commit_hash>
git checkout abc1234
```
